

PIECES

## Reflection

Unlike regular Tetris pieces, the custom polyomino piece is asymmetrical and irregular in design. It only fits correctly in a certain area on the board rather than being adaptable and simple to position. This gives the piece a unique function in the system and makes it feel more like a "key" than a regular block. Its dependence on the board layout, which transforms it from a general-purpose shape into a crucial puzzle piece, is its primary characteristic rather than its size.

The board state and the piece sequence are directly related. Every piece modifies the board in a way that makes room for the subsequent one, establishing an unchangeable, distinct order. The puzzle becomes logic-based as a result. Because comprehension of the structure is more important for success than quick thinking, the puzzle becomes logic-based rather than skill-based.

By employing false openings and shaped cavities that direct the player into either the right or wrong placements, the board presents a challenge. In keeping with the Big Bang puzzle style, the challenge is not speed but rather reading the system, which leads to a satisfying conclusion.
